

Since our blogger is away traveling we bring you a Fall post from just one year ago:

Well, this has been a week of settling into winter. Between changing clocks back to standard time and the downpours of rain it has seemed that winter is suddenly upon us. It would also seem that our neighborhood hummingbirds are feeling the same way!

This little guy has been roosting on my Hummingbird feeder all week. I open the curtains in the morning and there he is. On my day off I sat and watched as he (looking very grandfatherly) defended his position on the feeder and chased others away. Each day he has been there and soon I am sure I will have a name for him if he keeps this up.

Did you know:

Migration: Most, but not all, hummingbirds migrate south for winter. The Anna's hummingbird stays along the West Coast year-round. You won't interfere with hummingbirds' migration by leaving food out for them; they know to fly south as the days get shorter.

Eating: Hummingbirds use their tongues to lap up nectar and sugar water at about 13 licks per second.

Food: It isn't necessary to dye sugar water. Feeders with red part do the

trick. Insects and small spiders are also an important part of a hummingbird's diet. While red blooms draw them in, these sweet-toothed fliers will gladly feed from any color flower that produces nectar.

Predators: Besides other birds like hawks, hummers have to watch out for cats, spiders, snakes and even frogs.
